

We will now compute the Taylor series of second order for the $u\left(x-h,t\right)$ and $u\left(x+h,t\right)$ terms:

$$\begin{split} &\mu(1-(x-h))\times\dagger\times u\,(x-h,t)\\ &=\mu(1-x)\dagger u\,(x,t)-h\partial_x\left(\mu(1-x)\dagger u\right)+\frac{1}{2}h^2\partial_x^2\left(\mu(1-x)\dagger u\right) \end{split}$$

$$\mu(x+h) \times \ddagger \times u (x+h,t)$$

$$= \mu x \ddagger u(x,t) + h\partial_x (\mu x \ddagger u) + \frac{1}{2}h^2\partial_x^2 (\mu x \ddagger u)$$

We may now resume the computations (3) from above and add those new results:

$$\begin{split} \partial_t \left(u \left(\frac{i}{n}, t \right) \right) &= \dots \\ &= -\partial_x \left(\mu (1-x) \frac{\partial_X (x + n_X + aI)}{\partial_X (x + n_X + aI) + (N - x + n_Y + lN + 1 - \epsilon + \kappa \omega)} \right) \\ &- \mu x \frac{\partial_Y \left(N - x + n_Y + lN \right) + 1 - \epsilon + \kappa \omega}{\left(x + n_X + aI \right) + \partial_Y \left(N \right) \cdot x + n_Y + lN + 1 - \epsilon + \kappa \omega} \right) \\ &+ \frac{1}{2N} \dots \end{split}$$

So for $N \to \infty$

$$\partial_t \left(u \left(\frac{i}{n}, t \right) \right) = -\partial_x \left(\mu (1 - x) \frac{\theta_X (x + n_X + aI)}{\theta_X (x + n_X + aI) + (N - x + n_Y + bN + 1 - \epsilon + \kappa \omega)} \right)$$
$$-\mu x \frac{\theta_Y (N - x + n_Y + bN + 1 - \epsilon + \kappa \omega)}{(x + n_X + aI) + \theta_Y N - x + n_Y + bN + 1 - \epsilon + \kappa \omega)}$$

This means that the ODE due to the drift term in case $N \leftarrow \infty$ reads

$$\dot{x} = -\mu x \frac{\theta_Y (N - x + n_Y + bN + 1 - \epsilon + \kappa \omega)}{(x + n_X + aI) + \theta_Y N - x + n_Y + bN + 1 - \epsilon + \kappa \omega)}$$

$$+ \mu (1-x) \frac{\theta_X(x+n_X+aI)}{\theta_X(x+n_X+aI) + (N-x+n_Y+bN+1-\epsilon+\kappa\omega)}$$

Which is exatly the result stated in (0.1)
